How long to run filter cycle on hot tub

A hot tub is a great way to enjoy your backyard all year long. Your family will get hours of fun from your hot tub if you install it properly. Here are some things you need to know to make sure that you install your hot tub the right way. Pick the Right LocationOne of the most important concerns when you're installing a hot tub is where to put it. If you check hot tub reviews and ratings, you may see where other users located their hot tubs at their homes. You should check local regulations to ensure that you don't put your hot tub in a spot that is illegal. You also want a sturdy place for it, because a full hot tub is heavy. You'll want to make sure that it's close enough to your house to be convenient for entry and exit, especially during cold weather. You don't want it to be too far away, as you need to ensure good water pressure, and to ensure that the hot tub's electrical wiring is adequate. Prepare the Site Before You InstallBecause of the heavy weight of your hot tub when it's full, it's important to make sure that you have the proper support for it. You can pour a concrete pad that will ensure that you have enough of a foundation to support the weight, as well as provide easy entry and exit to the hot tub. Or you can purchase a kit from the manufacturer to build a spa pad. You should also check to make sure you can get electrical wiring or gas lines extended to your site. Make Sure You Have Everything You NeedBefore you begin installing your hot tub, make sure you have the materials and tools you need. You should make sure you've secured the proper permits for installation, as well as any approval you may need from your homeowner's association. Double-check to make sure that you have all the tools necessary to perform the installation properly. You need to make sure that you've bought everything necessary for hot tub electrical wiring or gas, as well as for plumbing. There's nothing more frustrating than repeat trips to the store to buy the things you've forgotten, so make sure you have everything before you get to work. Follow the InstructionsAfter you've gotten everything together, it's time to assemble your hot tub. One of the most important things you can do is make sure you follow the instructions carefully. Hot tub manufacturers provide directions for every step of the process, and if you follow them, you can be sure that you'll assemble it the right way. Don't skip a step or do things in the wrong order. Test Everything Before You Use Your Hot TubIt's important that you double-check to make sure that everything is working properly before you fill the hot tub. Test your plumbing and electrical wiring installation, or check gas lines if you're not using electricity for heating. If you run into problems, ask a professional for help. Clean the tub before you fill it as well. Once you've tested everything, you can fill your hot tub and get ready to enjoy it with confidence. MORE FROM QUESTIONSANSWERED.NET Photo Courtesy: Craig Moore/Bravo/NBCU Photo Bank/NBCUniversal/Getty Images When I was a kid, any family vacation that involved stopping at a hotel wasn't complete without a trip to the jacuzzi. Why's that? A hot tub — an item with the sole purpose of helping folks relax — seemed like the height of luxury. As we navigate the COVID-19 pandemic this summer, however, it looks like trips are going to be a bit closer to home. Whether you're creating a staycation oasis or just eager to soothe your tired muscles, there are plenty of wonderful hot tubs out there to fit your needs. Read on to soak in our team's favorite options. On the Move? You Can Take This Hot Tub with YouMaybe you share a backyard with neighbors — or you don't want to commit to a year-round hot tub — but the idea of spending summer nights in an at-home jacuzzi does sound appealing? Coleman, the maker of all things outdoors, has you covered with the SaluSpa Inflatable Hot Tub. That's right — inflatable. Photo Courtesy: Amazon But this isn't your average flamingo pool float. Durable, portable and easy to set up, this Coleman model can comfortably fit four adults and heats up to a toasty 104 degrees Fahrenheit. At the touch of a button, the tub heats up and 60 air jets — yes, you read that right — work with the hot water to provide a soothing massage. Bonus: If you're an avid camper, toss this in the car along with your tent if you're heading to a campground with amenities. The Plug-and-Play Hot Tub That's Just as Soothing for Your WalletFew tubs make the leadup to relaxation as much of a breeze as the relaxation itself than the American Spas 2-Person 28-Jet Premium Acrylic Triangle Spa Hot Tub. The term "plug-and-play" applies quite literally when it comes to this jacuzzi, but, despite the ease of setup, this tub doesn't sacrifice top-of-the-line features like similar tubs might. Photo Courtesy: Home Depot For those unfamiliar with the plug-and-play concept, this jacuzzi doesn't require a special electrical outlet and, instead, allows owners to plug it into any standard 120-volt outlet. The less home renovation the better — because that means more time feeling toasty and relaxed. Perfect for couples, the spa features two lounge seats with jets that follow the contours of one's body, making for an unparalleled hydrotherapy experience. This hot tub is also exceptionally durable, meaning it holds up in all seasons and types of weather. Soak in Style with a Spa Day-Level ExperienceIf you're one for creature comforts, choosing the right at-home hot tub can be tricky. So many jacuzzis seem to have all the bells and whistles — and the price tags to go along with those features. However, few stack up in performance to American Spas Freedom 7-Person 40-Jet Premium Acrylic Bench Spa Hot Tub with 2 Backlit LED Waterfalls and Steps. It even promises users they will "achieve ultimate relaxation." Does it get any better than that? Photo Courtesy: Home Depot That claim is backed by a ton of incredible features, such as 40 adjustable hydrotherapy jets, meaning hot tub users can pick a seat and then adjust their jets' pressure flow and direction to target specific stress points. Long story short, this tub can provide personalized, spa-level back massages. In addition to providing comfort for up to seven adults, it also boasts fun, atmospheric lighting features, including two backlit waterfalls that oscillate between seven colors and two different color modes. With this jacuzzi, you'll want to stay in until your skin prunes — maybe even longer. Want to Be Green? Soak in This Energy-Efficient Hot TubWorried about a new hot tub increasing your energy bills? The Corsica 8-Person 90-Jet Standard Hot Tub with Ozonator, LED Lights, WOW Sound System and Polar Insulation is a great option if that's among your chief concerns. To save valuable resources (and money), the Corsica spa utilizes an energy-efficient Econo-Boost heat recovery system that reuses recycled heat to further warm the tub's shell and water instead of venting it away. Photo Courtesy: Home Depot Sounds snazzy, right? Well, that's not all the spa has to offer. With two Super Hi-Flow energy-efficient pumps and a whopping 90 jets, the Corsica hot tub requires far less power than other spas in its class but doesn't sacrifice luxury. In fact, up to eight adults can soothe their sore muscles at one time while lounging around on multi-level seating contours. Without a doubt, this hot tub will be the star of your next backyard BBQ. A Spacious Hot Tub with Room for the Whole FamilyIf you have a big family, live with tons of roommates or simply love playing host, then a roomy backyard hot tub is a must. The AQUA 6-person 45-Jet Premium Acrylic Lounger Spa Hot Tub is, without a doubt, one of the roomiest and most luxurious models out there. Photo Courtesy: Home Depot With contoured seating and 45 jets aimed at users' upper and lower bodies, this spa is a dream come true for those in sore need of a massage. But the spa's focus on comfort isn't its only strength: The hot tub's HydroClear Ozonator purifies the water, keeping things clean and clear with little need for chemicals or maintenance. Bonus: You'll have the flashiest backyard oasis around thanks to the spa's cascading, LED backlit waterfall. MORE FROM CONSUMERSEARCH.COM Hot tub filters should be run for a minimum of 8 hours a day every single day. By keeping in accordance with this schedule, hot tub owners ensure that their hot tub water stays clean, the filters are not overused, and the cost of electricity is kept to an absolute minimum amount while still meeting proper safety needs. However, it is completely fine to run hot tub filters for longer periods of time if desired. Just remember that doing so will increase energy bills and is not typically necessary to maintain a hot tub's hygiene. In case you are interested to know more how much will your hot tub cost you every month, you can read this article. Can you clean hot tub filters? Spa filters should be cleaned regularly. They are designed to keep a hot tub's water clean. That means that filters collect all kinds of debris including dirt, hair, bugs, and even bacteria. If this debris is left inside the filter it continues to accumulate, and less and less is pulled from the water. Eventually, a filter becomes so dirty that it will begin to spit debris back into the water. In order to keep them clean and running efficiently, proper cleaning routines should be put into place. First, hot tubs should be rinsed thoroughly using a sink or a water hose every week. Then, every month filters should be removed from the hot tub and sprayed with a chemical rinse. After letting the rinse sink in for about fifteen minutes, the filters should be rinsed with water until clean. In addition, every three or four months when the dirty hot tub water is switched out, a hot tub's filters should be completely submerged in a diluted chemical solution for 24 hours. After this period, they should be rinsed and allowed to dry completely before being placed back into the hot tub. How long should a spa pump run per day? A spa pump should run for a minimum of 8 hours a day. In an ideal world, one would run all day every day. However, doing this is a quick way to run energy rates through the roof and the bills with it. Therefore, it is not a very plausible option for most hot tub owners. So, eight hours a day is a happy medium that will keep a hot tub functioning properly without skyrocketing bills. However, it should be noted that it is best to run a hot tub's pump on a cycle in which it turns on and off at set times throughout the day. Most hot tub owners prefer to run the pump in between peak times of electricity use in their area which can easily be done by giving one's electrical provider a quick phone call. How long should the filter cycle run on a hot tub? Standard hot tubs operating with single or two-speed pumps should have filtration cycles running for 4 hours twice a day. Once again, many hot tub owners prefer to run these cycles during non-peak hours in order to save on their utility rates. Similarly, if pinched for money, hot tub owners can get away with running filtration cycles for 3 hours a day twice a day instead of the aforementioned 4 hours twice a day. Should I leave my hot tub filter on all the time? Hot tub filters should be left on at all times. Most hot tub owners do not use their hot tubs every day. Therefore, it is often assumed that it is more energy-efficient to turn the hot tub on only when it is in use. However, frequently turning a hot tub on and off actually increases the amount of electricity used as it takes quite a bit of energy to heat a hot tub to an appropriate temperature. The only times a hot tub's filters should be turned off is during a cleaning or if the owner's leave for an extended period of time with a month or more passing between uses. How often should I run the filter on my Lay Z Spa? How often you should run the filter on your spa depends on the type and your hot tub use. For best results, it is recommended to leave your pump and filter running all the time if you use your spa frequently. This way, you will best maintain the heat of the water and at the same time allow the filter to clean the spa's water constantly. Meanwhile, many hot tub manufacturers advise turning off the filter while using the spa. On the other hand, if you use your spa less regularly, the best option is to set your filter to run at least eight hours a day. Many new spas have the switch button integrated, which allows you to control how many times a day and when the filter is running, while older ones do not have that option, and the filter is running all the time whether you want it or not. If you intend to reduce energy consumption, you can set the filter to run off-peak hours when it is possible. However, all spas are designed to run the filter when the heating is on automatically. Regardless of whether you run your filter 24 or 8 hours a day, you need to make sure that you do it regularly to maintain water movement to keep it safe and clean and filter out any unwanted dirt. When should I run the filter in my intex hot tub? When you run the filter is entirely up to you and your needs. After using a hot tub, you should run the filter to purify the water; to remove contaminants such as body oils, skin flakes, hair oils, leaves, etc. For the best performance, it is recommended that you run your filter for at least 3 to 4 hours twice a day. If you do not use your hot tub that frequently, you should run your filter occasionally to prevent the accumulation of dirt. The filter keeps your hot tub clean and ready to soak in. In addition, if you want to keep your hot tub clean and safe for use, you should keep your filters clean, too, and replace them when necessary. The filter maintenance depends on how frequently you use your hot tub and how many people use it. You should clean them every seven days or sooner if you use your spa often, and when the housing starts to degrade and is no longer usable and proves ineffective, it would be best if you changed them. How often should I run my hot tub filter? Since many filters have several options as to how often they can work, it is up to you to decide according to how frequently you use your hot tub. It should be enough to run your hot tub filter for up to eight hours a day. It would be best if you run it in two intervals of four hours. Running the filter will help your hot tub have adequate maintenance and remove any contaminants before they get to make your water dirty and unhealthy. Running your filter eight hours a day is the best recommended option. However, you can choose to reduce your filter running time based on how many people were using the tub and how often. For instance, if only an occasional two people use you can set your filter to cycle for two hours twice a day. But, if the tub were heavily used by six people or more, then it would be best to set your filter to work six to eight hours twice a day. How long you should run your filter also depends on the size of your hot tub. For example, a 200-gallon tub will take less time to filter the water than a 400-gallon tub. Additionally, some hot tubs have ozone set to be released during filter cycles, so if your filter works less frequently, you are decreasing the ozone output into the water. If you are worried about spending too much electricity, you can always program your filter to cycle during off-peak hours. Should hot tub filter run when adding chlorine? The hot tub filtration system cycles all water through the filter to remove the contaminants, making the water clean and healthy for use. Moreover, the filter's purpose is to ensure that the sanitizer, such as chlorine or bromine, is well mixed and thoroughly distributed through the water. You should run the hot tub's pump and filter for at least ten minutes at high speed to ensure proper water circulation, thus evenly distributing chlorine, which maximizes its efficiency. Another advantage of running the hot tub filter while sanitizing is that it will provide you with more accurate test results later. Nevertheless, be advised that when you use chlorine to sanitize the water, it would be best if you waited for the chlorine level to go back to 5 PPM, which takes about 24 hours for that to happen. How often do I need to replace my hot tub filter? Hot tub filters should be replaced every 12 months in order to easily keep the water fresh and clean. Failing to replace a hot tub's filter will result in unsanitary water and could potentially damage the hot tub itself. Changing the filters of a hot tub every 12 months should be often enough to keep them up to par. However, if a hot tub owner begins to see the following signs before those 12 months are up they may want to go ahead and replace the filters sooner: Unclear or cloudy water Visible signs of leaks or cracks in the filter causing it to lose the ability to function properly A hot tub's water still looks dirty after cleaning the filters Filters begin to become blocked more frequently and require more frequent thorough cleaning The pressure of the water going into a filter and the water going out of the filter is not the same. If any of these signs are noticed, hot tub owners should thoroughly inspect their hot tubs to ensure that there are no leaks, cracks, or malfunctions in any other area of the hot tub. If nothing is found, it is safe to assume that the filters are too dirty, too old, or simply need an upgrade, and new filters should be put in place as soon as possible. Obviously, no two hot tubs are the same so some personal judgement must be put into place when addressing the proper care for a hot tub. It is important to check one's owner manual to ensure there are no requirements specific to the hot tub in question. From there, hot tub owners should perform proper inspection and maintenance, and make their own decisions regarding running times and replacements in order to keep their hot tub running as smoothly as possible. However, while it may seem like tedious work at times, it is important to remember that frequent and thorough cleaning will help extend the longevity of any hot tub.
